"Biosynthesis of pteridines in Escherichia coli. Structural and mechanistic simularity of dihydroneopterin-triphosphate epimerase and dihydroneopterin aldolase.";

J. Biol. Chem. 273:17418-17424(1998).

G. I-FUNCTION: CATALYZES THE CONVERSION OF 7,8-DIHYDRONEOPTERIN TO 6-HYDROXYMETHYL-7,8-DIHYDRONEOPTERIN. GAN USE L-THREO-DHYDRONEOPTERIN G. G-HYDROXYMETHYLDIHYDROPTERIN, BUT IT CAN ALSO CATALYZE THE FINERIZATION OF CARBON 2' OF DIHYDRONEOPTERIN AND DIHYDRONONAPTERIN AT APPRECIABLE VELOCITY.

C. I-CATALYTIC ACTIVITY: 2-amino-4-hydroxy-6 (D-erythro-1,2,3-trihydroxypeopyl)-7,8-dihydropteridine = 2-amino-4-hydroxy-6-trihydroxymethyl-7,8-dihydropteridine = 2-amino-4-hydroxy-6-trihydroxy-6-trihydroxypeopyl)-7,8-dihydropteridine + glycolaldehyde.

C. I-SUBUNIT: HOMONOTAMER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                InterPro; IPR003098; role.

Refined crystal structure of ferrocytochrome c2 from Rhodopseudomonas viridis at 1.6-A resolution.";

J. Mol. Biol. 252:235-247(1995).

-i- FUNCTION: CYTOCHROME C2 IS FOUND MAINLY IN PURPLE, NONSULFUR, PHOTOSYNTHETIC BACTERIA WHERE IT FUNCTIONS AS THE ELECTRON DONOR TO THE OXIDIZED BACTERIOCHLOROPHYLL IN THE PHOTOPHOSEHORYLLATION PATHWAY. HOWEVER, IT MAY ALSO HAVE A ROLE IN THE RESPIRATORY CHAIN AND IS FOUND IN SOME NONPHOTOSYNTHETIC BACTERIA.
                                                                                                                                                                                         CHAIN

IT EITHER TRANSMITS CONFORMATIONAL CHANGES FROM CF(0) INTO CF(1). IT EITHER TRANSMITS CONFORMATIONAL CHANGES FROM CF(0) INTO CF(1) OR IS IMPLICATED IN PROTON CONDUCTION.

H(+) (Out).

SUBBUILT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE CARE AILPHA(3), BETA(3), GAMAA(1), DELTA(1), EPSILON(1). CF(0) HAS THREE MAIN SUBUNITS: A. B. AND C.

SUBGEBLULAR LOCATION: CYANELLE THYLAKOID MEMBRANE.
SIMILARITY: BELONGS TO THE ATPASE DELTA CHAIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.
